Wireframes

What is a Wireframe?

A wireframe is a 2D outline of a webpage or an app. It acts as an architectural blueprint. The page structure, layout, information architecture, user flow, functionality, and expected behaviours are all clearly outlined in wireframes. Style, colour, and graphics are minimal because a wireframe typically depicts the original product concept.

What is the Purpose of wireframing?

Wireframes have three main purposes.

1. They are quick and inexpensive to construct.

2. Maintain the user-focused approach.

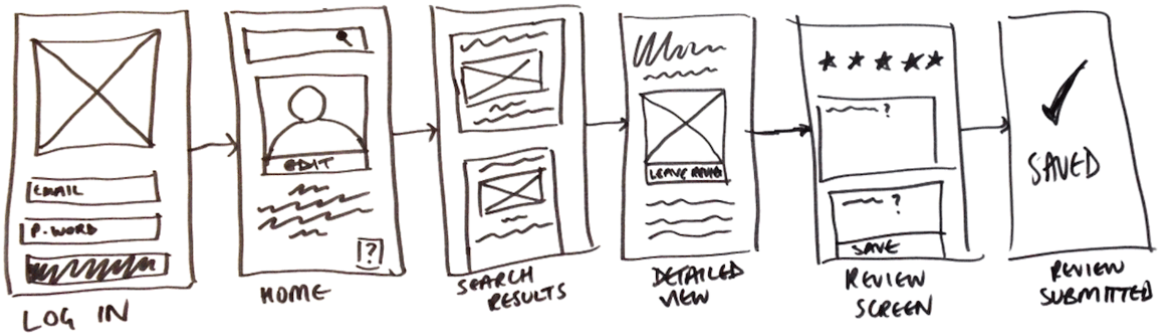
3. Define and clarify website functions.

After gathering insights from the users/stakeholders, the development of the wireframes takes place. Designers can build on the next, more detailed version of the product design, such as a prototype or mock up.

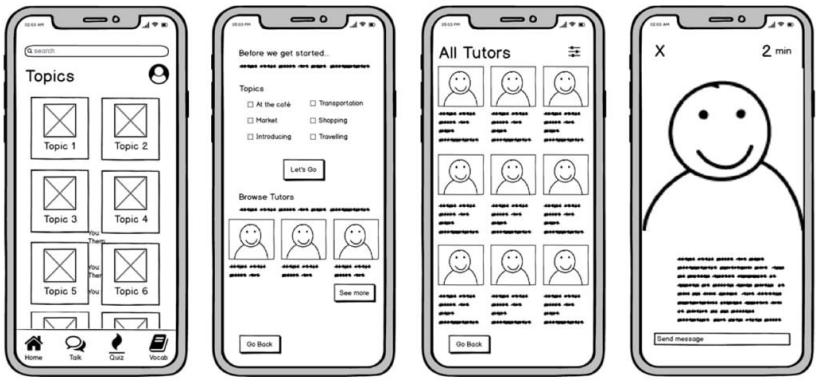
Different Types of Wireframes

There are three types of wireframes.

1. Low-fidelity wireframes – A basic visual representation of the webpage. Usually known as the design's starting point.



2. Mid-fidelity wireframes – The most commonly used wireframes out of the three types of wireframes. Contains a more accurate representation of the webpage layout. Do not contain detailed representations such as images, typography etc.



3. High-fidelity wireframes – The final stage of the wireframe designing. High-fidelity wireframes replace the text fillers, image indicators, etc. using actual featured images and pertinent textual content.

Mid-Fidelity Wireframe
